| EXP.NO: 4       | Create a web form that accepts a user's name and age. Write a Servlet to process the form data and display it back on the browser. |
| DATE:26/02/2025 |                                                                                                                                    |

### AIM:

To create a simple web application that includes a form to accept a user's name and age, and then use a Servlet to process the submitted data. The Servlet will retrieve the form data, process it, and display the values back on the browser.

### ALGORITHM:

#### 1. Input:

- The user fills out a web form with their **name** and **age** and submits it.

#### 2. Form Handling and Servlet Processing:

##### 1. Create the Web Form:

- Create an HTML form with **two input fields**: one for the user's **name** and one for the user's **age**.
- Add a **submit button** to the form.
- Set the form's action attribute to the URL of the **Servlet** and the method to POST (or GET).

##### 2. Create the Servlet Class:

- Write a Servlet that processes the **form data** submitted by the user.
- The Servlet will override the doPost() (or doGet()) depending on the form method) to handle form submissions.
- The Servlet will **retrieve the name and age** parameters from the request object using request.getParameter("name") and request.getParameter("age").

### 3. Process the Data in the Servlet:

- Extract the name and age values submitted from the form.
- **Validate the input** (e.g., check if the age is a valid number).
- Prepare a **response** that will display the user's **name** and **age** back on the browser.

### 4. Send Response to the Browser:

- The Servlet will send a **response** to the browser containing a message like:
  - "Hello, [name]! You are [age] years old."
- The response will be displayed to the user in the browser.

### 5. Deploy the Servlet:

- Compile the Servlet and deploy it to a **Servlet container** (like **Apache Tomcat**).
- Ensure the web.xml file or Servlet annotations are used to map the Servlet to the URL defined in the form's action attribute.

### 6. Test the Application:

- Open the web browser, fill in the form with the name and age, and submit it.
- The Servlet will process the data and display the message back to the user in the browser.

### Program:

#### studentform.html:

```
<!DOCTYPE html>
<html>
<head>
  <title>Student Entry Form</title>
```

```
<style>
  body{
    font-family: Arial;
    background:#dbeafe;
    text-align:center;
    margin-top:100px;
  }

  .box{
    background:white;
    width:350px;
    margin:auto;
    padding:25px;
    border-radius:10px;
    box-shadow:0 0 10px gray;
  }

  input{
    width:90%;
    padding:8px;
    margin:10px;
  }

  button{
    padding:10px 20px;
    background:#0d47a1;
    color:white;
    border:none;
    cursor:pointer;
  }
</style>
</head>
<body>
```

```

<div class="box">
    <h2>Student Information Form</h2>

    <form action="studentinfo" method="post">

        <input type="text" name="sname" placeholder="Enter Student
Name" required>

        <input type="number" name="sage" placeholder="Enter Age"
required>

        <button type="submit">Submit</button>

    </form>
</div>

</body>
</html>

```

### StudentInfoServlet.java:

```

@WebServlet("/studentinfo")
public class StudentInfoServlet extends HttpServlet {

    protected void doPost(HttpServletRequest request,
        HttpServletResponse response)
        throws ServletException, IOException {

        String name = request.getParameter("sname");
        String age = request.getParameter("sage");

        response.setContentType("text/html");

        PrintWriter out = response.getWriter();

        out.println("<html><body style='font-family:Arial; text-align:center; margin-top:100px;'>");
    }
}

```

```
        out.println("<h1 style='color:blue;'>Student Information  
Management System</h1>");  
  
        out.println("<h2>Student Details Submitted Successfully</h2>");  
  
        out.println("<p><b>Name:</b> " + name + "</p>");  
        out.println("<p><b>Age:</b> " + age + "</p>");  
  
        out.println("</body></html>");  
    }  
}
```

**Output:**

The screenshot shows a web form titled "Student Information Form" centered on a light blue background. The form is a white rounded rectangle with a subtle shadow. It contains two text input fields stacked vertically. The first input field contains the text "Gowtham" and the second contains "19". Below these fields is a blue rectangular button with the word "Submit" in white text.

# **Student Information Management System**

## **Student Details Submitted Successfully**

**Name:** Gowtham

**Age:** 19

### **RESULT:**

A Servlet is created to process the HTML form data and display it back on the browser.
